

High precision surface finishing solutions for reliable, consistent results. Edge-Breaking – Deburring – Smoothing – Cleaning

As a full service provider for surface finishing Spaleck Oberflächentechnik is a leading manufacturer of machine and process technology for the efficient finishing of metals and other engineering materials.

Rising demands of customers concerning surface quality and cleanliness require a continuous development of machine technology. Space-saving construction, rising throughput and a high automation degree in connection with an integrated part logistic functionality are key elements of that development.

The performance profile of the throughfeed vibrators DL 1000 and DL 2000 is ideally adapted to those requirements. By a channel length of 14 or 18 meters a treatment time of 10 to 15 minutes can be realized. This is possible by the vertical spiral design, using height and not length and width as seen at conventional throughfeed installations.
